

LHC Beam-Beam Compensator

Status Summary and preliminary Specification

R.J. Steinhagen

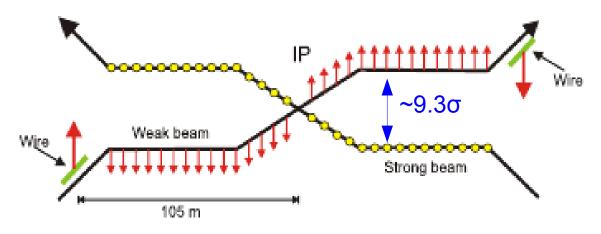

for and with input from:

O. Aberle, R. Assmann (Collimation), A. Bertarelli, Ch. Boccard, A. Dallocchio, M. Gasior, R. Jones, J.-P. Koutchouk, F. Bertinelli, E. Metral, D. Perini, T. Rijoff, R. Veness, R.J. Steinhagen, J. Wenninger (MPP), F. Zimmermann (ABP lead), M. Zerlauth

Motivation for Installing a BBC Prototype in the LHC I/II - Passed several Milestones

Initial proposal based on to J.-P. Koutchouk's note: CERN-SL-2001-048-BI

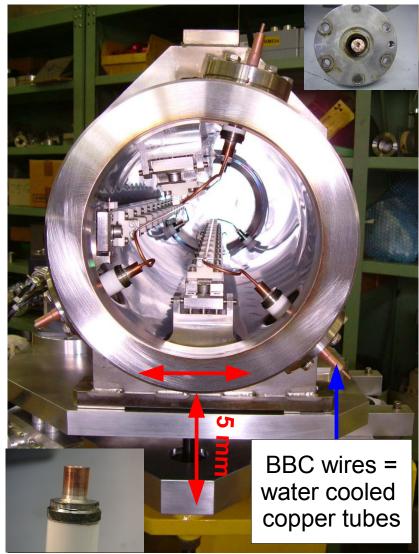

- Since, SPS wire-wire and RHIC beam-wire experiments demonstrated that: (for details → F. Zimmermann, e.g. Chamonix' 11 & http://http://cern-ab-bblr.web.cern.ch/)
 - 1. "detrimental wire effect on life-time can be compensated by another wire"
 - 2. Benchmark of numerical tool chain \rightarrow indication of what to expect at LHC
 - What could be tested at the SPS and RHIC has been tested,
 - Still, no direct/consistent demonstration of beneficial effect on life-times
- Further tests require a true long-range beam-beam limited machine...
 → proof-of-principle requires BBC prototype into machine before HL-LHC
 - Endorsed by Chamonix'11 (Session8) and LMC (meeting #82) *"Launch a project for the LRBB compensating wire in present LHC..."*

- SPS and donated RHIC design are incompatible for installation in LHC:
- Diff. aperture, beam pipe, mechanics, ...
- Wire needs to be in between beams
- Free-standing wire & RF resonances
 ↔ classic λ/n-antenna (impedance issues)
- Not robust w.r.t. beam impact
- Moveable tank bears the inherent risk of breaking and of bursting of:
 - vacuum bellows ↔
 require movement of > 10 mm
 - water cooled interconnects
 - bursting/water leaks inside the vacuum chamber ie. in response to impact of nominal bunch, n-flux fatigue or 1kW of inherent heat → A. Bertarelli's Chamonix'11 talk

 \rightarrow inacceptable due to too big impact on LHC operation in case of failure.

- LHC-BBC scheme (\rightarrow ABP, F. Zimmermann et al.)
 - provide a adequate test-bed to experimentally assess its potential performance for present and future HL-LHC upgrade scenarios
- LHC Machine Protection (discussed/agree with MPP)
 - should either cope with asynchronous beam-dump scenario or not deteriorate machine performance after such an event
- LHC Beam Cleaning (Collimation WG, R. Assmann et al.)
 - preserve/provide the same function as present collimator hierarchy
- Practical considerations, 'KISSS' Keep the Impact Simple, Small and Safe:
 - feasibility from an engineering point of view
 - Should not deteriorate present machine performance (e.g. impedance..)
 - required instrumentation to setup, assess and verify its performance

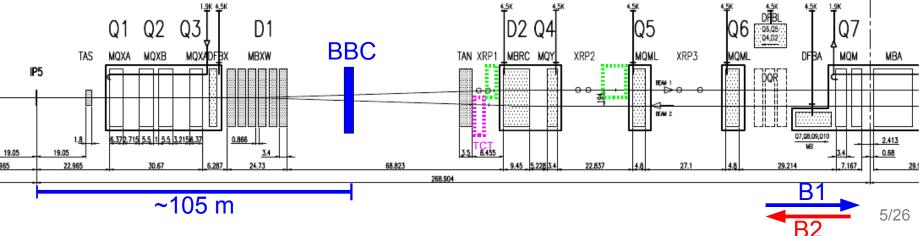

Reservations around IR1&IR5, LHC-BBC-EC-0001:

	name	Position and longitudinal dimensions
IR1	BBC.4L1	-104.931 m ± 1.5m wrt IP1
	BBC.4R1	104.931 m ± 1.5m wrt IP1
IR5	BBC.4L5	-104.931 m ± 1.5m wrt IP5
	BBC.4R5	104.931 m ± 1.5m wrt IP5

- Min. LRBB → BBC phase advance: $\Delta \mu \approx 2.6^{\circ} (\rightarrow 3.1^{\circ})$
- Symmetric beta-function: $\beta_{x/y} \approx 1000 \text{ m}$ (for $\beta^* = 0.55 \text{ m}$)
- N.B. single vacuum pipe for B1 & B2:
 110 mm full beam separation (only D1 only)
 (→ 165 mm, if shifted more towards TAN)

Physical Space IR5 Requires Horizontal BBC

reserved location IP \rightarrow 105 m

Between Q4 and Q5

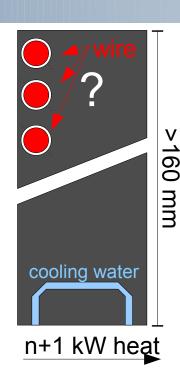

- Initially 2 BBC per beam/IP planned → H-V pair for one beam only, based on H-V crossing scheme, settled with:
 - 1 x BBC-H.B1 in IR5, and
 - 1 x BBC-V.B1 in IR1
 - Wire parameters:
 - Solid wire radius of ~ 1mm \rightarrow 1kW power dissipation
 - Wire diameter is a trade-off between available aperture and cooling
 - sub- σ level of hor./ver. position control
 - Nominal scheme: $I = I_{peak} \cdot \sqrt{2\pi} \cdot \sigma_s \cdot n_{parasitic} = 72 \dots 350 \text{ Am (max.)}$
 - Pulsed wire to accommodate differences for PACMAN bunches
 → not feasible/practical at this stage, stick to DC compensation only
- Further, aim to reuse as much of established infra-structure as possible to aid/simplify controls integration into an operational LHC environment:
 - Collimator type girders, motor control and to embed the wire into jaws
 - standard e.g. LHC-type 600 A power converter (OK w.r.t. ripple requirement)
 - Integration of buttons as done for the TCT to aid the wire re-alignment

- Wire-beam distance: average LR beam-beam separation of 9.7 σ
 → implies a-priori similar nominal BBC position
 - closer than present and possibly future TCT settings
 - critical w.r.t. asynch. dump failure mode, in particular for B2 in IP5
- Not without issues \rightarrow validated this with MPP (Meeting #48, 2011-08-05)
 - Somewhat relaxed constraints: BBC prototype targeted to be an MD tool
 → special run conditions, reduced intensity and time which mitigates
 probability of e.g. asynchronuous dump failure impacting the wire (failure
 rather impacts device rather than machine availability)
 - Conclusion: LHC BBC Prototype will need to be ...
 - A)... either operated in the shadow of the TCTs (e.g. 11 σ), or
 - B)... provide a similar combined function as the TCTs (e.g. 9.7 σ) \rightarrow so far positive feedback from Collimation WG (R. Assmann et al.) provided we meet the same reliability requirements as the TCTs

- Using collimator-type design 'kills several birds with one shot':
 - 1. provides necessary mechanical stability (N.B. 1 m long wire)
 - 2. easy wire position control, integration and exchange option
 - 3. intrinsic heat sink, conducting thermal losses far away to where these can be safely coupled out of the tank
 - 4. Experience w.r.t. integration BPM buttons, etc.
 - 5. Depending on jaw-material choice, shielding of RF beam IC to reduce impedance and potential wire resonances
 - Min. insulation + copper surface (skin depth): 0.3 mm tbc.)

 However, a true 'TCT' like functionality implies some constraints on material choice and trade-off w.r.t. robustness vs. cooling vs. Impedance

	Th. Cond.	El. Cond.	δ@40 MHz	δ@1 GHz	
	[W m ⁻¹ K ⁻¹]	[Ω m]	[µm]	[µm]	В
Copper	401	1.7·10- ⁸	~10	~2	ore
Tungsten	173	5.6·10 ⁻⁸	~10	~2	5 S
SiC*	360 - 490	8.3·10 ⁻³ - 3	~mm	~mm	bu
Carbon		3·10 ⁻⁶ 8·10 ⁻⁴			st
Diamond	900232041k	~10 ¹²			•

Proposed LHC Beam-Beam Compensators Prototypes I/III – Option I (nominal): between D1 ↔ TAN

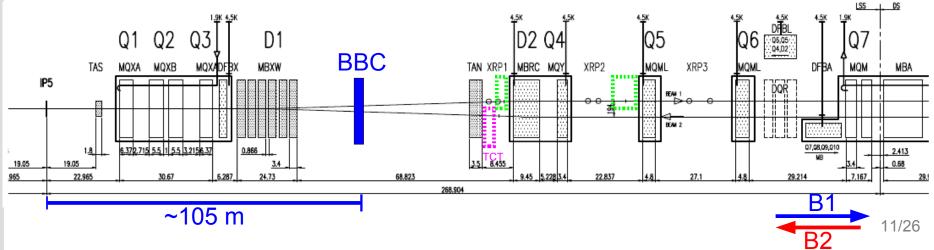

Non-neglible *n*-flux, impedance and TAN aspects need detailed simulations
 Materials choices: Cu, W, Carbon, SiC (doping issues?), (CVD) Diamond
 Major design and qualification effort, unlikely to be ready before LS1!

Proposed LHC Beam-Beam Compensators Prototypes II/III – Option I (nominal): between D1 ↔ TAN

- The ideal/reserved BBC location is more challenging
 - Physical margin of 110 mm & β_{x/y}≈ 1000 m (for β*= 0.55 m), depends highly on planned HL-LHC scenario, cons./safe assumption: σ≈ 0.7 … 1 mm for nominal optic, ε=3.6 µm and 7TeV → 3.5 TeV
 - would gain for larger β^* and/or smaller $\epsilon,\,e.g.\,2\,\mu m$
- Assuming that we require a minimum physical 20 sigma clearance (x2) for the BBC in the parking position \rightarrow leaves only about 70 mm for BBC

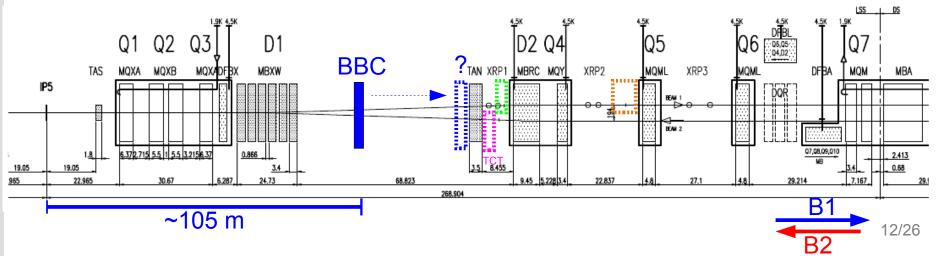

Proposed LHC Beam-Beam Compensators Prototypes III/III – Option II TCT-like BBC

- Alternate options implying an easier integration and potential LS1 installation
 B) Combined TCT-BBC at the present TCT locations
 - some constraints on material
 - C) Replacing roman pots (BBC targets HL-LHC)
 - D) Between Q4 & Q5 \rightarrow needs further simulations

Addressed by Tatiana's talk

- Advantage could re-use even the same vacuum tank design as TCTs
 - Possible integration in LS1, final installation during shorter TS afterwards
 - beside n-flux, other aperture and MP issues remain the same
 - Need some early indication to prepare machine for additional vacuum valves, BPM and control cables, water, power cables, etc.

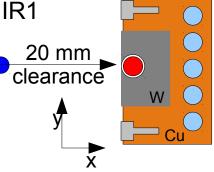

Tatiana's presentation on BBC compatibility with TCT location

- Initially two units: 1 x BBC-H.B1 in IR5, and 1 x BBC-V.B1 in IR1
 - same location as present TCTs
- Reuse as much of established infra-structure as possible (collimator type girders/motor control, LHC-type 600 A PC)
- Wire-in-jaw design:
 - Embedded (insulated) Cu wire inside W block
 - Possibility of 1+n wires (spare/redundancy)?
 - 100 um between wire and active cleaning surface (RF screening)
 - Wire parameters:
 - Solid (round) wire radius of ~ 1mm and 1 m length
 - sub- σ level of hor./ver. position control (e.g. 0.1 mm)
 - nom. scheme: $I \cdot I_{wire} = I_{peak} \cdot \sqrt{2\pi} \cdot \sigma_s \cdot n_{parasitic} \cdot I_{wire} = 72 \dots 350 \text{ Am (max.)}$
 - DC compensation only
 - cooled via passive heat transfer (1 kW)
- Additional beam instrumentation
 - BPM 2x2 buttons (for wire re-alignment)
 - Additional (fast) BLMs, bunch-by-bunch orbit and Q diagnostics

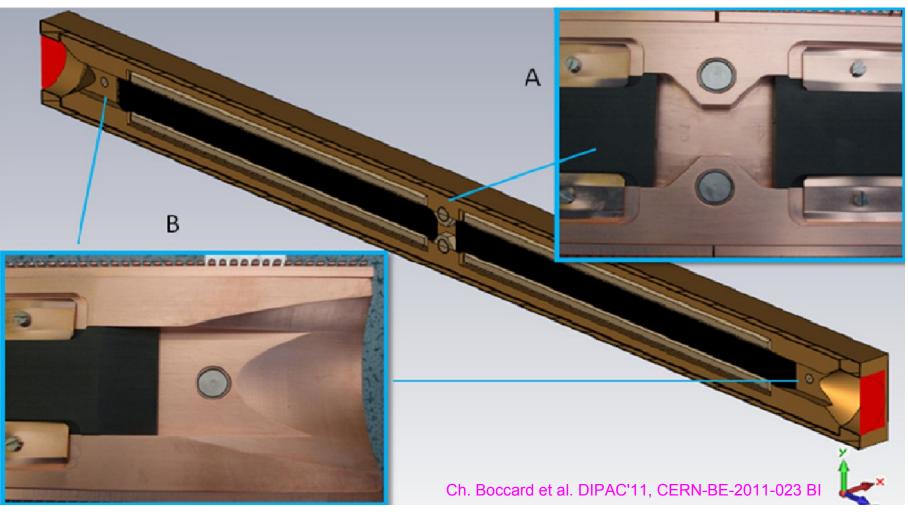

LHC

Example: SPS Prototype Design

Design functionally tested w.r.t. BPM response, integration etc.

Main required modifications: wire-in-jaw, larger buttons \rightarrow cable/water routing

- Mechanical re-design of TCT wire-in-jaw design
- Mechanical feasibility, material and vacuum compatibility tests
 - mechanical and electrical constraints (breaking, insulation)
 - vacuum compatibility (outgasing)
 - \rightarrow lab mock-up test to validate design (fellow)
- Impact on machine impedance and pick-up response
- Beam cleaning and robustness simulations (FLUKA)
- Preparation of technical infrastructure in LS1
- Add. R&D and beam instrumentation
- BBC prototype construction
- Pre-installation prototyping and HW integration tests (Lab-cycling)
- Controls integration
- Future R&D and miscellaneous

Conclusions

- Planned BBC prototype deployment to assess its potential in view of HL-LHC
- Wire-in-jaw' design: robustness, thermal and impedances management
 - originally BBC between D1↔TAN: possible but likely only for LS2
 - Now preferred option of TCT-style design
 - could be prepared/installed for LS1):

- Next steps:
 - Circulation and approval of detailed specification (by 2011/2012)
 - Re-evaluation w.r.t. shifted location/future optics \rightarrow T. Rijoff (ongoing)
 - Required resources and time planning estimates \rightarrow later today
 - External review and approval by HL-LHC and LMC
